AB CF3CH2OH (I), useful as a heat transfer medium and monomer, was purified by refluxing crude I containing S compds. as impurities with excess aqueous H2O2, followed by distillation with alkalis. Thus, AcOCH2CF3, prepared

from AcOK and CF3CH2Cl, was hydrolyzed to give crude I containing 420 ppm SO42-, which was refluxed with aqueous H2O2 for 48 h. After addition of Na2SO3 to decompose excess H2O2, the solution was rectified with aqueous KOH to give a distillate of b.p. $70-95^{\circ}$. The distillate contained S at <1 ppm SO42-.
